Kashima 34-m Radio Telescope

Eiji Kawai, Mamoru Sekido, Ryuichi Ichikawa

Abstract

The Kashima 34-m radio telescope is continuously operated and maintained by the National Institute of Information and Communications Technology (NICT) as a facility of the Kashima Space Research Center (KSRC) in Japan. This brief report summarizes the status of this telescope, the staff and activities during 2008.

1. General Information

The Kashima 34-m radio telescope (Figure 1 left) was constructed as a main station of the "Western Pacific VLBI Network Project" in 1988. After that project's termination, the telescope has been used not only for geodetic purposes but also for astronomy and other purposes. The station is located about 100 km east of Tokyo, Japan and co-located with the 11-m radio telescope and the International GNSS Service station (KSMV) (Figure 1 right). This station is maintained by the Space-Time Measurement Project of the Space-Time Standards Group of KSRC, NICT.

2. Component Description

The Kashima 34-m radio telescope can observe L, C, K, Ka, Q, S, and X bands. The main specifications of the telescope and receivers are summarized in Table 1 and Table 2.

The original frequency coverage of the X-band was from 7860 MHz to 8600 MHz. In order to support IVS observing, we expanded the frequency range of the X-band receiver up to 9080 MHz [2]. For S-band, we have been using the high-temperature superconductor (HTS) band-pass filter

Main reflector aperture	34.073 m		
Latitude	N 35° 57' 21.78"		
Longitude	E 140° 39' 36.32"		
Height of AZ/EL intersection above sea level	43.4 m		
Height of azimuth rail above sea level	26.6 m		
Antenna design	Modified Cassegrain		
Mount type	AZ-EL mount		
Drive range azimuth	North $\pm 270^{\circ}$		
Drive range elevation	7° - 90°		
Maximum speed azimuth	$0.8^{\circ}/\mathrm{sec}$		
Maximum speed elevation	$0.64^{\circ}/\mathrm{sec}$		
Maximum operation wind speed	$13 \mathrm{m/s}$		
Panel surface accuracy r.m.s.	$0.17 \mathrm{~mm}$		

Table 1. Main specifications of the 34-m radio telescope.

Table 2. The receiver specification of the 34-m radio telescope.

Band	frequency (MHz)	Trx(K)	Tsys (K)	Efficiency	SEFD (Jy)	Polarization
L	$1350 - 1750 \star$	18	45	0.68	200	L/R
\mathbf{S}	2193 - 2350	19	72	0.65	340	L/R
\mathbf{C}	4600-5100	100	127	0.70	550	L(R)
X-n	8180-9080*	41	48	0.68	210	L/R
X-wL	8180-9080 #	41	67	0.68	300	L/R
X-wH	7860-8360 #	-	67	0.68	300	L/R
Κ	22000-24000	105	141	0.5	850	L(R)
Ka	31700-33700	85	150	0.4	1100	R(L)
\mathbf{Q}	42300-44900	180	350	0.3	3500	L(R)

*: 8GHz LNA narrow band use.#: 8GHz LNA wide band use.

 \star : Narrow bandwidth filter, 1405 - 1435 MHz, is used generally.

to mitigate the radio frequency interference (RFI) signal due to a third-generation mobile phone system (IMT-2000) [3]. For L-band, we also installed a band-pass filter to mitigate RFI on July 15, 2008. The band-pass frequency is from 1405 to 1435 MHz.

3. Staff

The engineering and technical staff of the Kashima 34-m radio telescope are listed in Table 3. Tetsuro Kondo began working in Korea in April 2008, but he continues to support the software correlator of NICT. Yasuhiro Koyama moved to NICT HQ in July 2008, but he continues to support the 34-m antenna. Ryuichi Ichikawa is responsible for the project at Kashima instead of Yasuhiro Koyama.

Name	Main Responsibilities	
Eiji Kawai	responsible for operations and maintenance	
Mamoru Sekido	software and reference signals	
Kazuhiro Takefuji	mechanical and RF related parts	
Ryuichi Ichikawa	responsible for the project	
Yasuhiro Koyama	international e-VLBI	
Tetsuro Kondo	software correlator development and e-VLBI	

Table 3. The engineering and technical staff of the Kashima 34-m radio telescope.

4. Current Status and Activities

The 34-m radio telescope contributed to various experiments (such as geodesy, radioastronomy, space navigation, and time transfer). Statistical charts of the telescope operation time according to purpose, including maintenance, is shown in Figure 2. The total operation time during 2008 was 2047 hours, which decreased compared to the previous year's total of 2319 hours. The main reason for this is that there was annual maintenance and repainting of the backup structure.

Figure 2. Statistical charts of the telescope operation time according to purpose.

The yearly maintenance was carried out from late August until the end of September. The backup structure of the telescope was repainted from late November through the end of December.

5. Future Plans

The Kashima 34-m radio telescope is a main telescope of our project, and already a lot of sessions such as "Experiment for the development of a 1.6 m antenna system", "Ultra-rapid UT1 experiment with e-VLBI", and "VLBI experiment for Time Transfer" have been scheduled. Also we are planning repainting to keep up the telescope's good condition in February and March, and from August through the middle of October.
