

Scheduling a VLBI Session

John Gipson
NVI, Inc/NASA GSFC
7th IVS TOW Meeting
Haystack, MA

May, 2013

Prerequisites & Goals

Prerequisite:

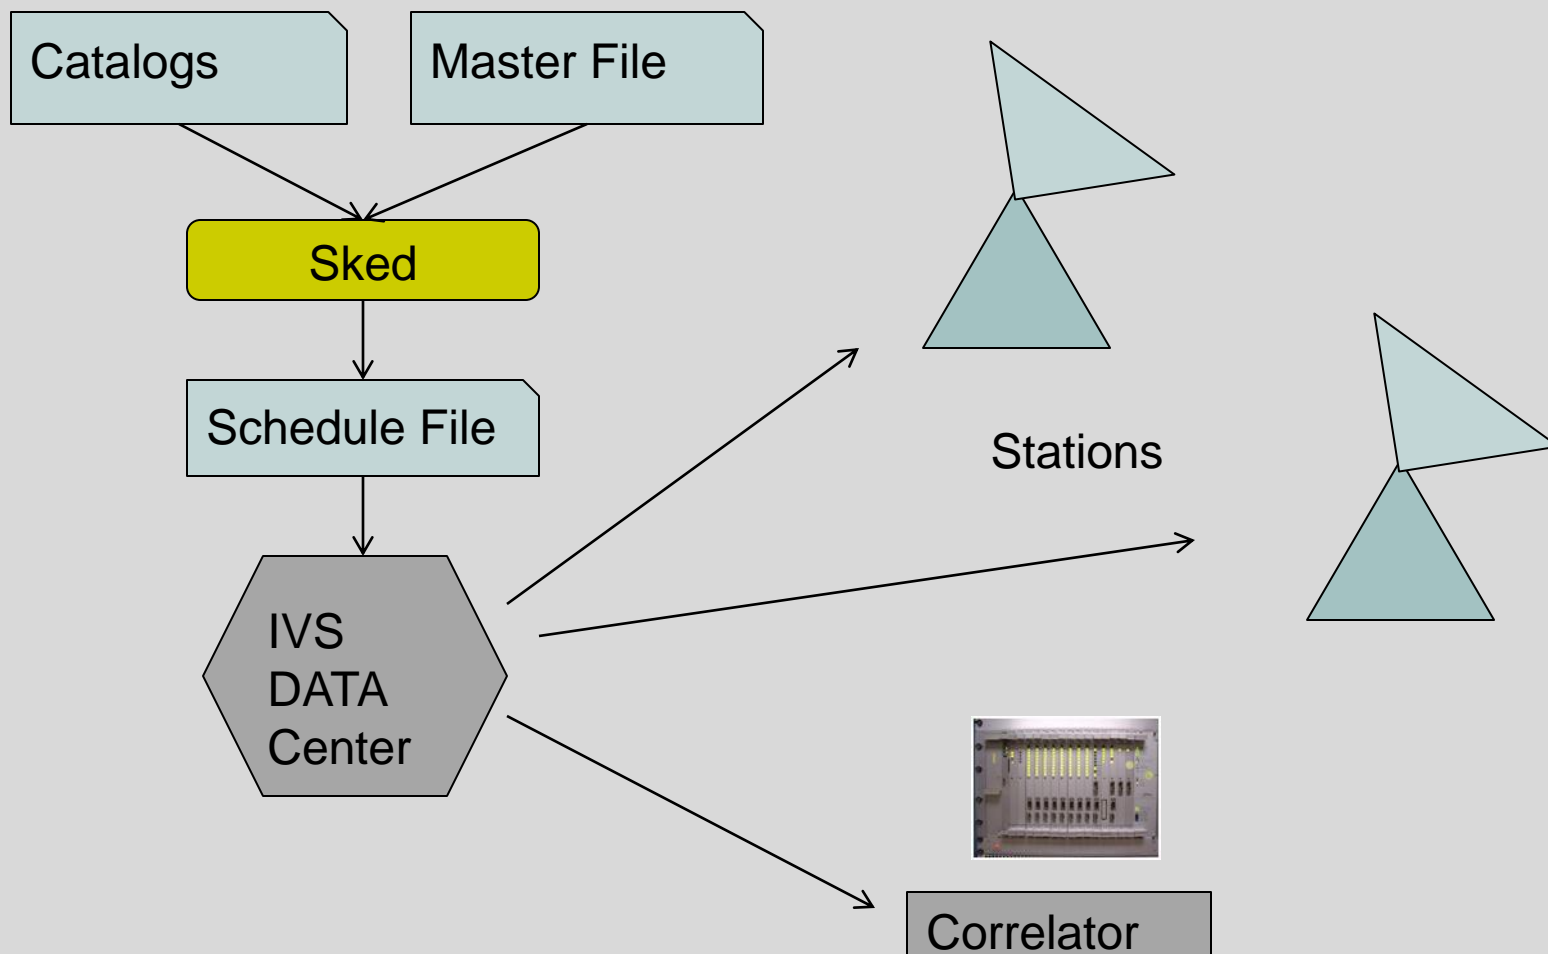

- General understanding of VLBI.

Goals:

- General understanding of scheduling.
- Some understanding of sked.
- Ability to produce simple schedules (R1, R4...)
- Ability to do some tweaking of schedules

Sked Data Flow

Terminology (1)

Site: A location with one or more VLBI antennas. GGAO is a VLBI site with two VLBI antennas.

Station: A given VLBI antenna together with all the electronics and recording equipment.

Source: Something that is observed by VLBI. Usually a quasar, but could be satellites or spacecraft.

Scan: A set of two or more VLBI antennas simultaneously observing the same source.

Observation: The result of cross-correlating the signal from two VLBI antennas in a scan.

Subnetting: When two sets of stations simultaneously participate in different scans.

Terminology (2)

Schedule File: A complete specification of a session. Includes information describing:

- Station positions
- Antenna parameters
- Electronics and recorders
- Source positions
- Source flux models
- Frequency mode
- A complete list of all scans in the session

Catalogs: A set of files used by scheduling programs that describe information used in scheduling. There is one catalog for each category of information: Antenna.cat, Source.cat, Flux.cat,

Terminology (3)

Sked: The program most often used to schedule geodetic VLBI sessions. Sked was developed by Nancy Vandenberg (NVI/GSFC) and is currently maintained John Gipson (NVI/GSFC)

Sched: A program used to schedule Astronomy VLBI sessions. Sched was developed and is maintained by Craig Walker.

Vie_sched: An alternative program written in Matlab to schedule Geodetic VLBI sessions. Vie_sched was developed by Jing Sun at TU.

Master File: All of the sessions for a given year. It specifies start time, duration, stations and type of schedule: R1, R4, CRF, EURO,....

Terminology (3)

SKD format: Format for writing schedule format. Developed by Nancy Vandenberg.

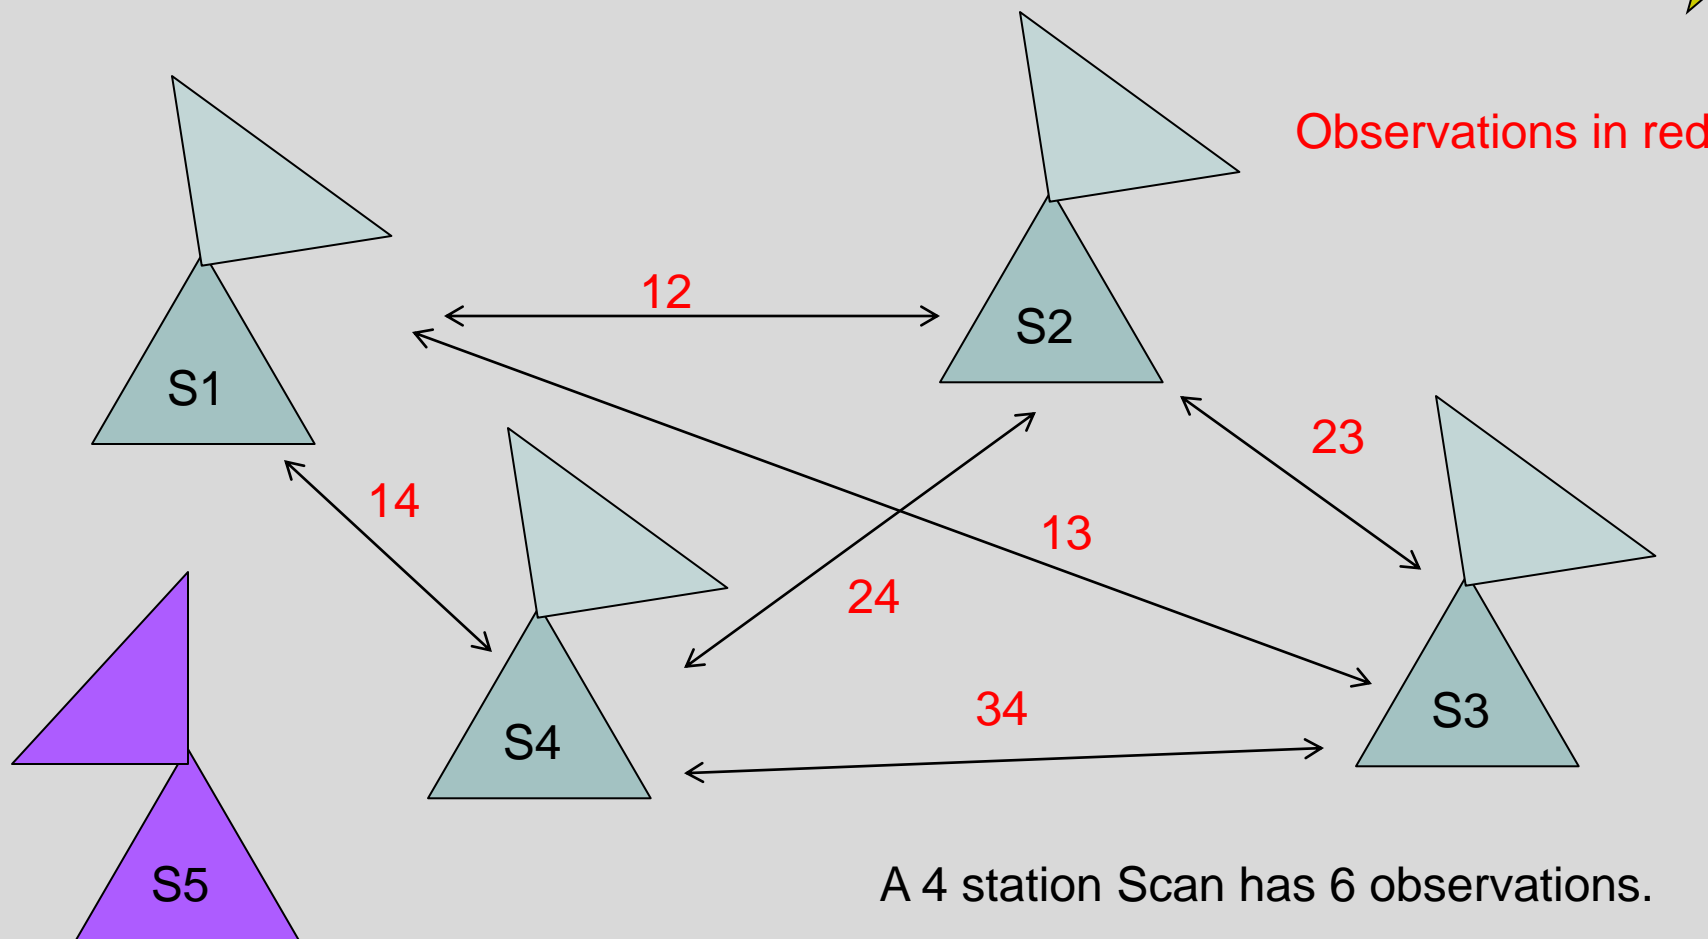

VEX format: An alternative more modern format. Used at the correlators. Sked can write VEX files.

Scans & Observations

There are many observations in a single scan.

Scans and Observations

	1	2	3	4	5
1	11	12	13	14	15
2	21	22	23	24	25
3	31	32	33	34	35
4	41	42	43	44	45
5	51	52	53	54	55

Square has $N \times N$ elements.

We are interested in elements above the diagonal.

This is $(N \times N - N) / 2 = N * (N - 1) / 2$

Subnetting

When two sets of antennas simultaneous participate in different scans.

SNR Calculations

$$SNR = \frac{\overset{\text{Source Strength}}{\downarrow} F}{\underset{\text{Antenna SEFDs}}{\uparrow} \sqrt{SEFD_1 \times SEFD_2}} \times \frac{\overset{\text{Number of Bits}}{\downarrow} \sqrt{2 \times BW \times NumChannels \times Scanlength}}{\underset{\text{Correction Factor}}{\uparrow} 1.75}$$

Increasing SNR

To increase SNR you can:

- Increase $F \rightarrow$ Stronger sources
- Decrease SEFD \rightarrow Larger antennas or better electronics
- Increase Number of bits
 - Increase scan length
 - Increase BW
 - Two bit sampling
 - Increase number of samples

The ideal source is:

- Strong
 - Strong sources take less integration time. This means you can take more observations.
- Compact
 - Non-compact sources have lower flux on long baselines.
- No Source Structure
 - Source structure introduces 'noise'.

Goddard periodically reviews the source list trying to find the best compromise between compact and strong.

<ftp://gemini.gsfc.nasa.gov/ftp/pub/sked/catalogs/source.cat.geodetic.good>

Good Source

OK Source

Bad Source With Structure

Source Fluxes

Fluxes above 0.25 are observable.

Scheduling a Scan

If you wanted to generate a schedule by completely by hand you would:

1. Determine what sources were visible now at which antennas.
2. Calculate time for antennas to slew to source.
3. Calculate source-flux on all baselines.
4. Calculate integration time based on SNR.
5. Pick scan to use.

Repeat for the next scan.

Most of this is just 'plug-and-chug' calculations—no thinking required.

The only item that requires thought is item 5.

This lead to the creation of scheduling programs to do the calculations for you.

Modern scheduling programs like sked and Vie_sched can even select the scans automatically.

What is a Good Schedule?

- Generally, the more observations the better.
- Like to have, at a minimum 10-12 scans/hour at each station.
- No gaps in schedule. We are unhappy if a station is not observing.
- Not too much idle time.
- Even sky distribution over periods ~ 1 hour or less.
- Some low elevation scans to help separate atmosphere and clocks. (*But too low will hurt because we introduce noise by mis-modeling the atmosphere.*)

What is Sked

Sked is a **command line based** scheduling program developed by Nancy Vandenberg and maintained by John Gipson

Sked prompt Command Arguments

Brief History of Sked

History

1978	Basic program created (Nancy Vandenberg) command line input manual selection of scans catalogs for sources, stations, equipment
1981	Automatic calculation of antenna motion and tape handling
1988	Automatic selection of observations (Autosked) Optimization by strict covariance.
1992	Evaluation of schedules using SOLVE simulations Creation of pseudo-databases to evaluate formal errors.
1993	Autosked merged into standard version. “Strange” schedules
1995	Beginning of rule based schedules.
1996	Mark IV/VLBA recording mode support added Last time sked documentation updated.

Brief History of Sked

History (Cont)

1997	Numerous changes Support for VEX files Y2K fixes, new Java-based catalog interface S2 and K4 support
2002	John Gipson takes over development/maintenance Fill-in mode Best-N Source Selection
2004	Linux port by Alexey Melnikov Beginning of death of HP-sked Astrometric option: Specify min, max observing targets for set of sources.
2005	Full support of Disk-based recording: Mark5A, Mark5B, KK5
2006	Downtime: Ability to specify when an antenna is unavailable.
2009	Station limit raised from 32→64, and made parameter.

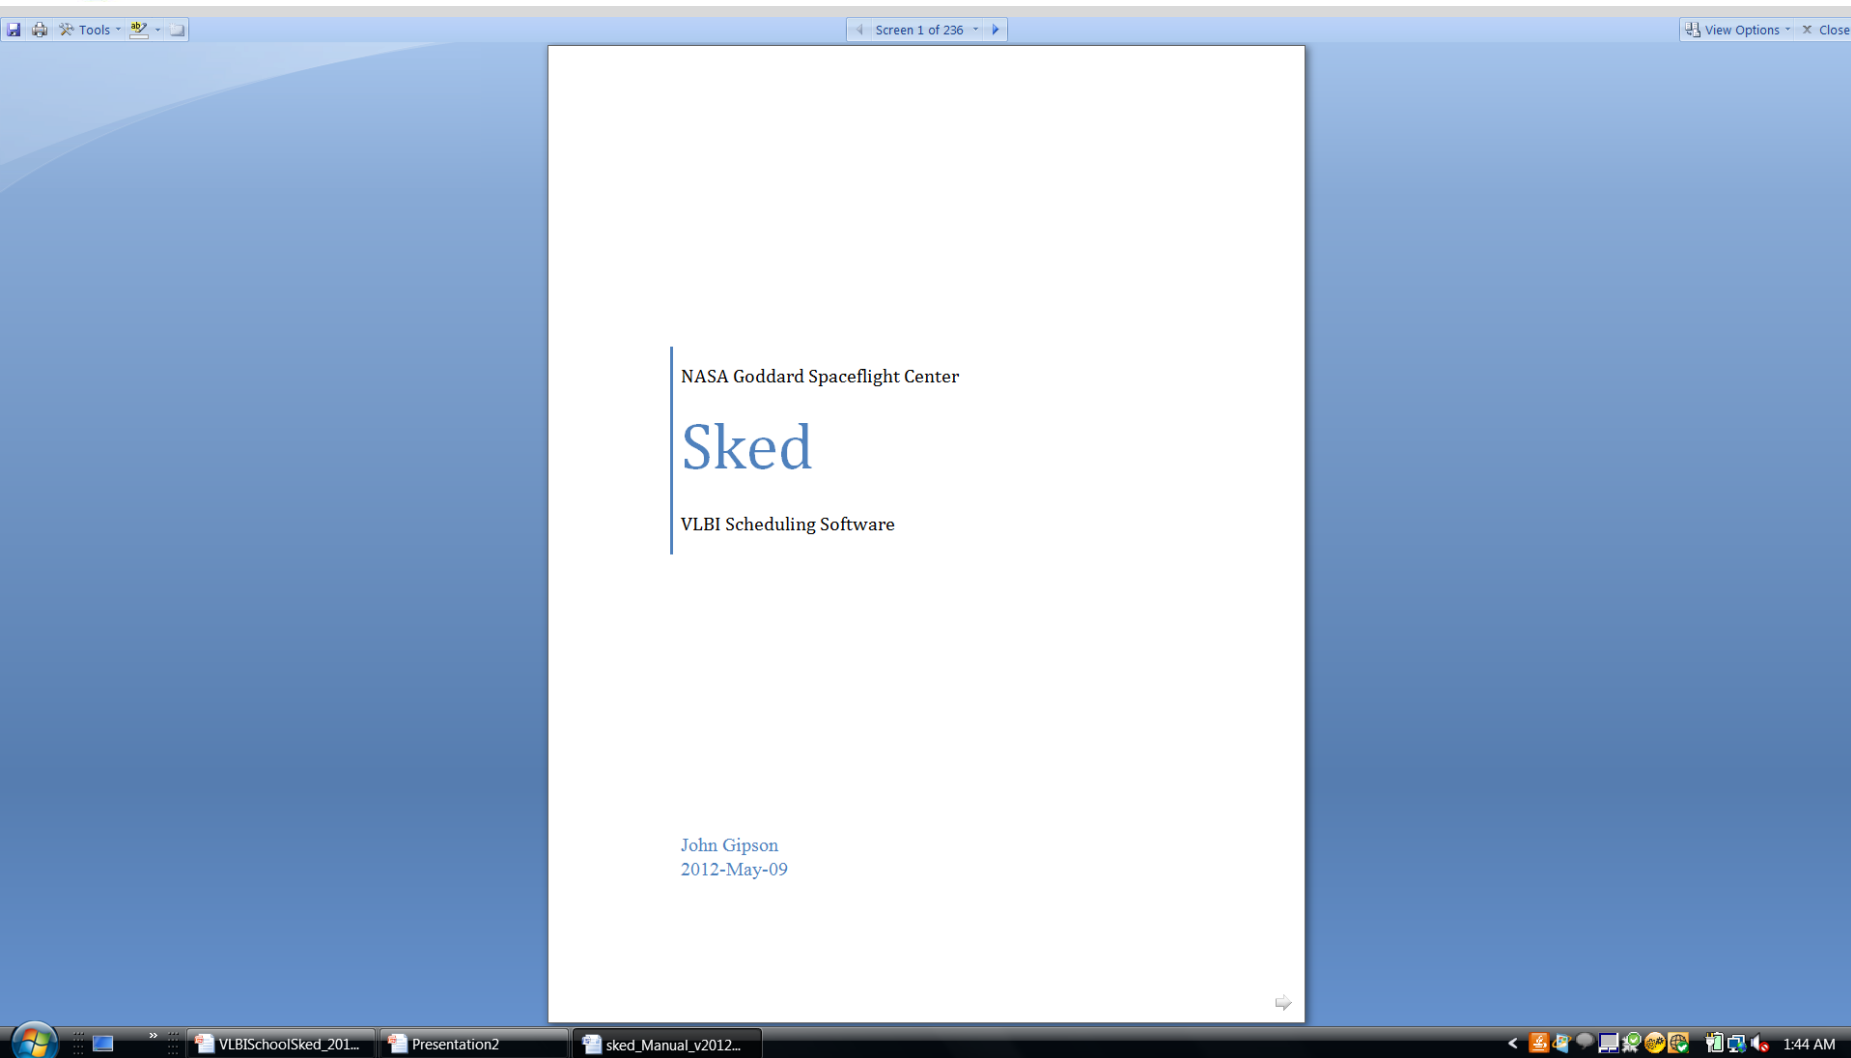

Brief History of Sked

History (Cont)	
2007	Resurrection of covariance optimization. Found and fixed various bugs in algorithms. Still not used routinely. By-product: sked can predict formal errors internally.
2008	Master command Read session setup from master file. Check session against master file.
2011	Introduction of MinAngle minor option. Limits closeness (in the sky) of the next source.
2012	Release of new Sked Manual. Update documentation (<i>only 16 years out of date!</i>) Prepare for VLBI2010 Transitioning to native VEX format.
Next	What else do you want?

Your Friend: Sked Manual

John Gipson NVI, Inc./NASA GSFC
Scheduling VLBI Sessions

Sked Manual

Contains

- ***172 jam-packed pages full of thrills and chills***
- All of the sked commands with examples and screen shots.
- Algorithms used in sked
- Cookbook for making schedules

<ftp://gemini.gsfc.nasa.gov/pub/sked/>

Sked Time Commands

Sked has several different ways of specifying the time. General format is:

YYDDDDHHMMSS

DDD=Day of Year

Can insert ":" "-" or "/" for readability.

If the year and DOY are absent, assume current year and DOY time. The following are all equivalent.

- **09355170000**
- **09/355/17:00:00**
- **17:00:00**

Sked also recognizes several special times.

Special Sked Times

. , Now	Current time
^ , Begin, Start	Beginning of experiment
* , End, Last	End of experiment or last scan scheduled, depending on context

Top Sked Commands

Command	Description
?	Sked help
List	List the schedule
Check	Check the schedule
Summ	Summarize schedule
Master	Check the schedule against the masterfile. Setup up the schedule using the masterfile.
SNR	Set, list SNR targets.
Station	Set, list stations
Source	Set, list sources
Freq	Set, list frequency modes
/ SRCNAME	Schedule a source manually
Auto	Automatic scheduling
Major	Set major options
Minor	Set minor options
Param	Set, list parameters
Down	Specify a station is unavailable
BestSource	Select the best sources for a given network.
Wr, wc	Write out a file.
Quit	Quit.

Getting Help in Sked

Typing ? at the sked prompt gives a summary listing of all sked commands.

```
? ?
!      Shell to system          /      Insert new scan
?      Info for <command>      ^      Previous line
ABORT   Abandon all changes    ADD      Add station to scan
ALLOCATION Set, list tape allocation  ASTROMETRIC Set desired #obs limits
AUTOSKED Auto generate schedule  BACK      Back up in the schedule
BESTSOURCE Find best sources    CATALOG   Start/get catalog info
CHECK    Check schedule         COMMENT    only used in scripts
COVERAGE Report coverage by station  CURRENT   List current scan
DELETE   Delete scan(s)        DOWNTIME  Set/list station Downtime
EARLY    Set, list early start   EC        Create sked file & exit
ELEVATION Set, list el limits    ER        Write sked file & exit
FLUX     Select or list flux     FREQUENCY Set,list freq. modes
HELP     List this screen       LIST      List scans
MAJOR    List, select major opts  MAX       List max parameter values
MASTER   Compare schedule, master  MEDIA     Set, list media types
MINOR    List, select minor opts  MODIFY    Modify current scan
MONITOR  Get sources to monitor   MOTION    Set, list tape motion
MUTUALVIS Display mutual vis.     NEXT      List next scan
OPTIMIZATION Set, list optimization  PARAMETERS Set, list parameters
PID      List Process ID #        PREVIOUS  List previous scan(s)
PRINTL   Print file - landscape   PRINTP    Print file - portrait
QUIT     Immediately w/o asking    REMOVE    Remove station
... .
```

About 80 sked commands in all.

Getting Help in Sked

For all commands if you type

`"? cmd_name"`

you will get more information about the syntax

Note: Can abbreviate sked command as long as abbreviation is unique.
Hence "li" is the same as "list".

```
? ? li
LIST [<range> [<source> [<subnet> [<ellim>]]]]
<range> is ALL or <start>-<stop> or <start>#<number>
        <start>,<stop> are yydddhmmss or ^(top),
.(current), *(end) or first, last, begin, end,
```

Getting Help in Sked

For newer commands if you type

" Cmd ?" you will get more complete information.

```
? xlist ?
```

```
List, Clear, Toggle Extended listings
```

```
Usage: Xlist <option>
```

```
?          This screen
```

```
Clear      Clear all values
```

```
List       List values currently set
```

```
Off        Turn off extended listing
```

```
On         Turn on extended listing
```

```
--otions listed below--
```

```
AzEl       AzEl
```

```
Feet       Tape footage
```

```
HA         Hour Angle
```

```
Long       Long format for AzEl
```

```
Sky        Sky distribution info
```

```
SNR        SNR by baseline
```

```
Wrap       Include cable wrap
```

```
?
```

List Command

```
? list .
```

Note that "." = current time

Source, Freq Commands

Work very similar to Station command.

Source Sel

Allows you to select sources.

Source Li

Lists the sources

Freq Sel

Allows you to select frequency modes

Freq Li

Lists the frequency modes.

DOWNTIME

Frequently stations are unavailable for part of a session. The most common reason is that the station drops out to **participate in an Intensive.**

In the past, schedulers had to “stop” and “start” the station manually.

1. Generate schedule to start of downtime.
2. Remove station from subnet.
3. Generate schedule until just after end of downtime.
4. Put station back in subnet.

The downtime setting makes this unnecessary.

The user **specifies which stations will be down, and for how long.**

Downtime Command

Down without any arguments lists the current downtime settings.

```
? down
Wz-Kk 2010-074-18:15:00 2010-074-19:45:00
?
```

You can easily remove a station from the downtime listing.

```
? Down Wz off
? Down
Kk 2010-074-18:15:00 2010-074-19:45:00
?
```

To add a station to the downtime listing you must specify the station and stop and start times.

```
? down wz 200000 210000
? down
Kk 2010-074-18:15:00 2010-074-19:45:00
Wz 2010-074-20:00:00 2010-074-21:00:00
?
```

Downtime: How it works.

A scan is rejected because the station is down if:

1. The end of the scan is in downtime.
2. The beginning of the scan is in downtime

Downtime: How it works.

A scan is rejected because the station is down if:

1. The end of the scan is in downtime.
2. The beginning of the scan is in downtime
3. There is downtime in the middle of a scan

Master Command: Motivation

Before 2008, users would set up a schedule by doing the following:

1. Start with a similar schedule: `cp r1412.skd r1413.skd`
2. For the new schedule, determine the following from the masterfile:
 - A. Start time;
 - B. Stop time;
 - C. Stations;
3. Modify the new schedule accordingly.
4. Change the \$EXPER parameter in the schedule.
5. Make the schedule.

Master Command: Motivation

Before 2008, users would set up a schedule by doing the following:

1. Start with a similar schedule: `cp r1412.skd r1413.skd`
2. For the new schedule, determine the following from the masterfile:
 - A. Start time;
 - B. Stop time;
 - C. Stations;
3. Modify the new schedule accordingly.
4. Change the \$EXPER parameter in the schedule.
5. Make the schedule.

There were several schedules with wrong stations or incorrect stop and start times.

Master Command

The Master command checks the schedule against the masterfile.

It uses the \$EXPER parameter in the *sked* file as a key.

There are two modes:

1. **Master check:** Compares *sked* file against master, and reports discrepancies.
2. **Master get:** Reads the master file to determine a) start and stop time; b) stations; c) Correlator; d) Scheduler. Puts this in the schedule file.

This makes generating a schedule much **easier, and reduces the chance of error.**

Some schedulers have complained that this makes *sked* too easy!

Master Check

```
? master check
Finding session R1410
Checking /shared/gemini/ftp/pub/master/master10.txt
Checking /shared/gemini/ftp/pub/master/master10-int.txt
Checking /shared/gemini/ftp/pub/master/master09.txt
master_cmd: schedule and master file agree!
?
```

Master Check

```
? master get

?

Types of Scheduling

Two modes of scheduling:

1. **Manual mode.** User specifies everything about a scan.
2. **Automatic mode.** Sked determines best scan based on heuristic rules. These rules are a distillation of what works.

These modes can be intermixed. Sked can run in auto-mode for a while, then scheduler can insert scans by hand, and return to auto-mode.

Manual Scheduling

User specifies everything about the scan. General form:

```
/ src_name [start time] [sub Subnet] [dur duration]
```

src_name is required. The terms in brackets are optional. If they are omitted, sked will try to schedule a scan with the maximum number of stations which meets the SNR targets, as soon as possible after the current time.

If it detects problems (doesn't meet SNR targets, a station is unavailable, etc.,) sked will notify the user and ask if they want to proceed.

Example:

```
/ 3c84 start 17:30:00 sub NyWzWt
```

A typical R1 has about 900 scans→900 commands if scheduling manually.

Automatic Mode

In automatic mode, the user instructs sked to schedule a network until some endtime.

```
? Auto subnet endtime
```

Example:

```
Auto KkWfNyMa 19:30:00
```

Generate scans with Kokee, Westford, NyAlesund, Matera until 19:30:00.

Example:

```
Auto _ End
```

Generate scans with full subnet from the current time to end of the session.
A single command in automatic mode instead of 900 in manual mode.

If *endtime* is not specified, sked will schedule a single scan:

```
Auto _
```

Automatic Mode

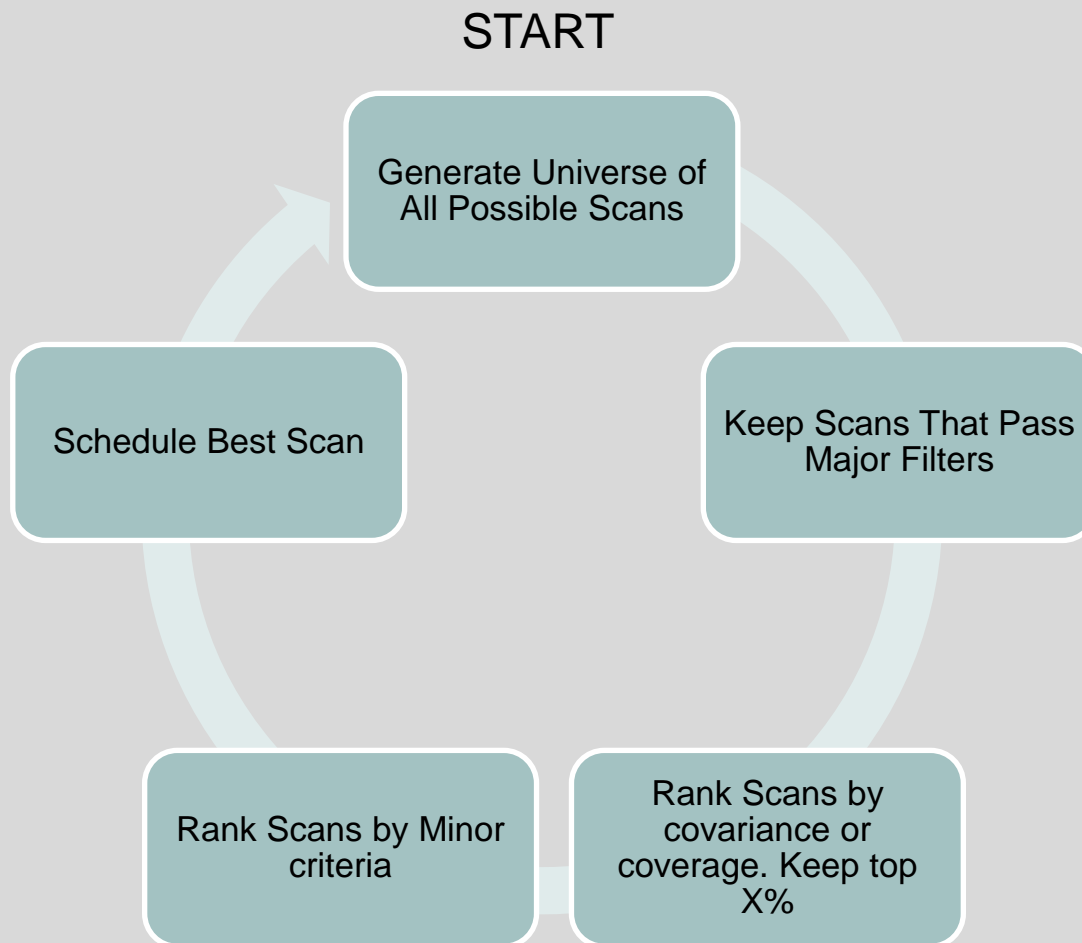

In automatic mode, user specifies general parameters for scheduling the session. *Sked* generates and schedules the scans.

Two kinds of parameters (or options):

1. **Major options** determine what scans are considered for inclusion.
2. **Minor options** determine the *ranking* of the resultant scans. The highest ranked scan is selected.

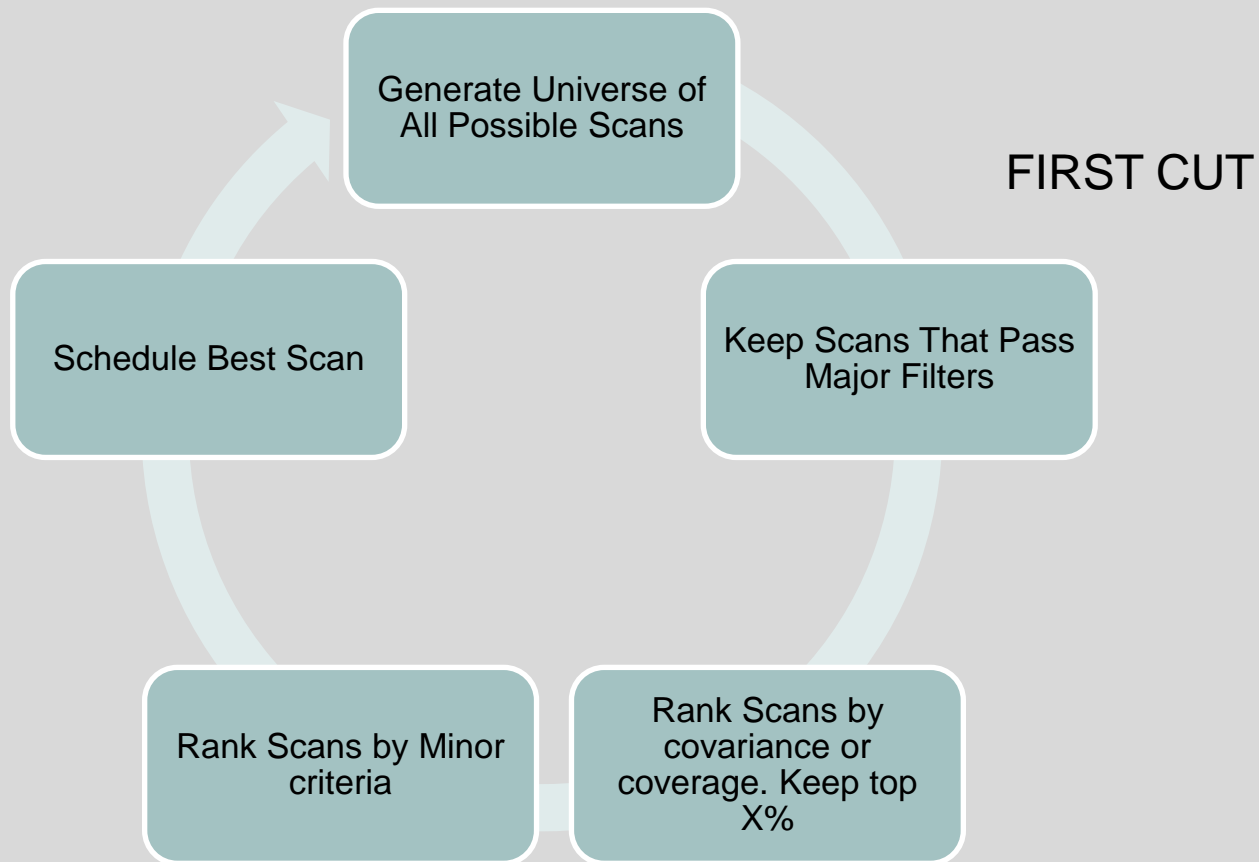

Automatic Scheduling

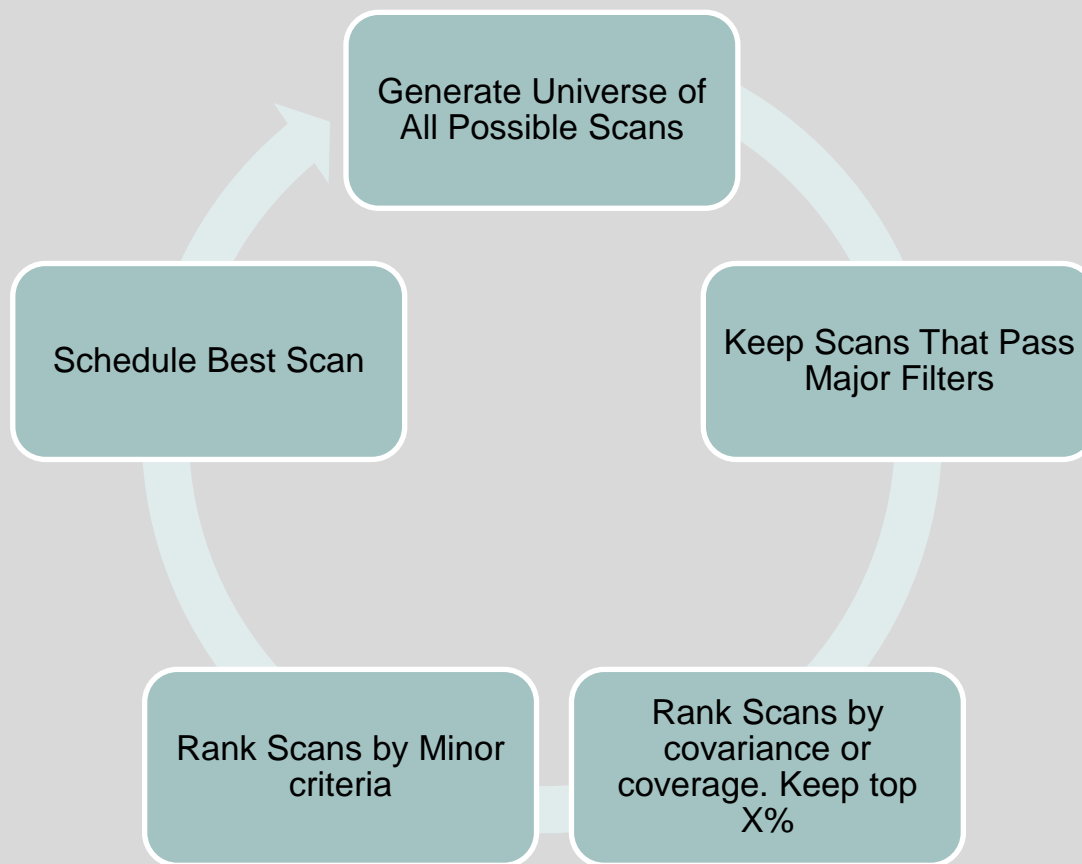

Automatic Scheduling

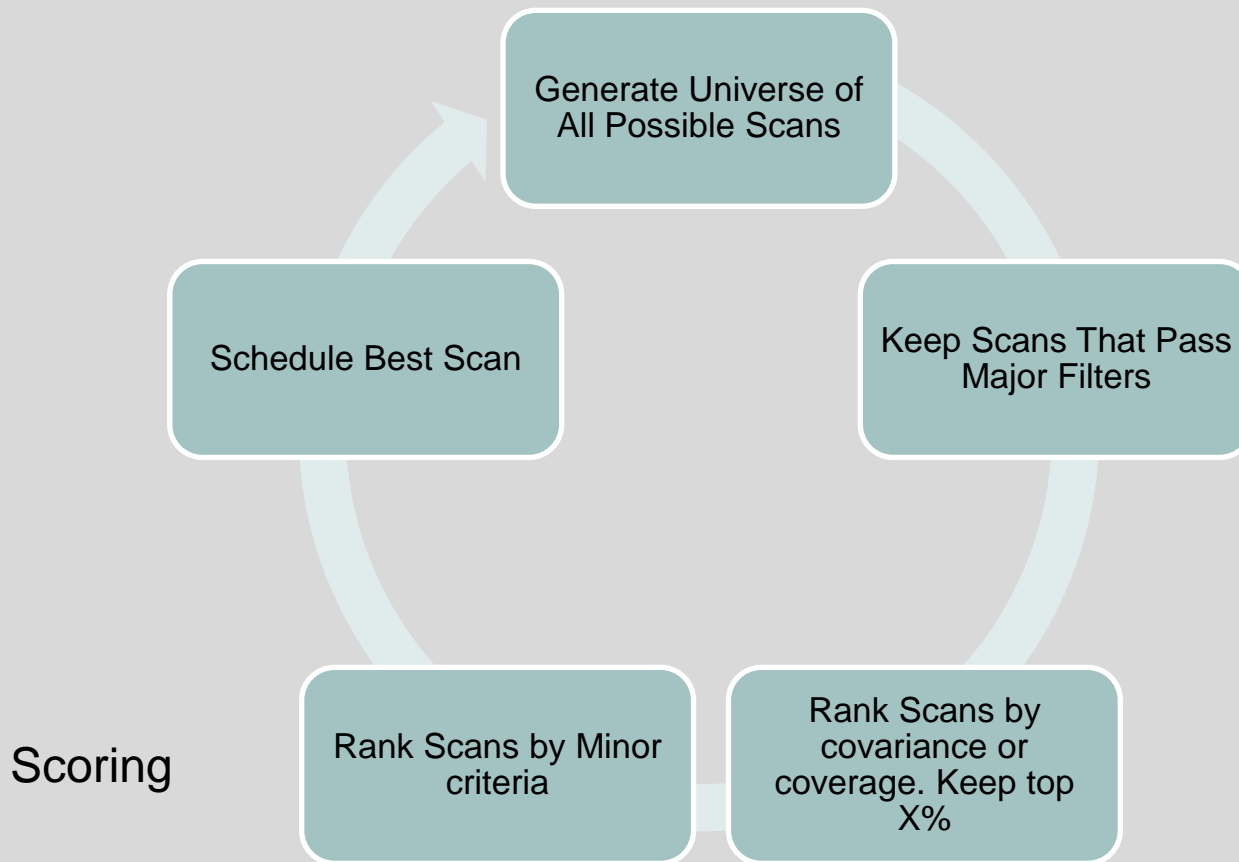

Automatic Scheduling

SECOND CUT

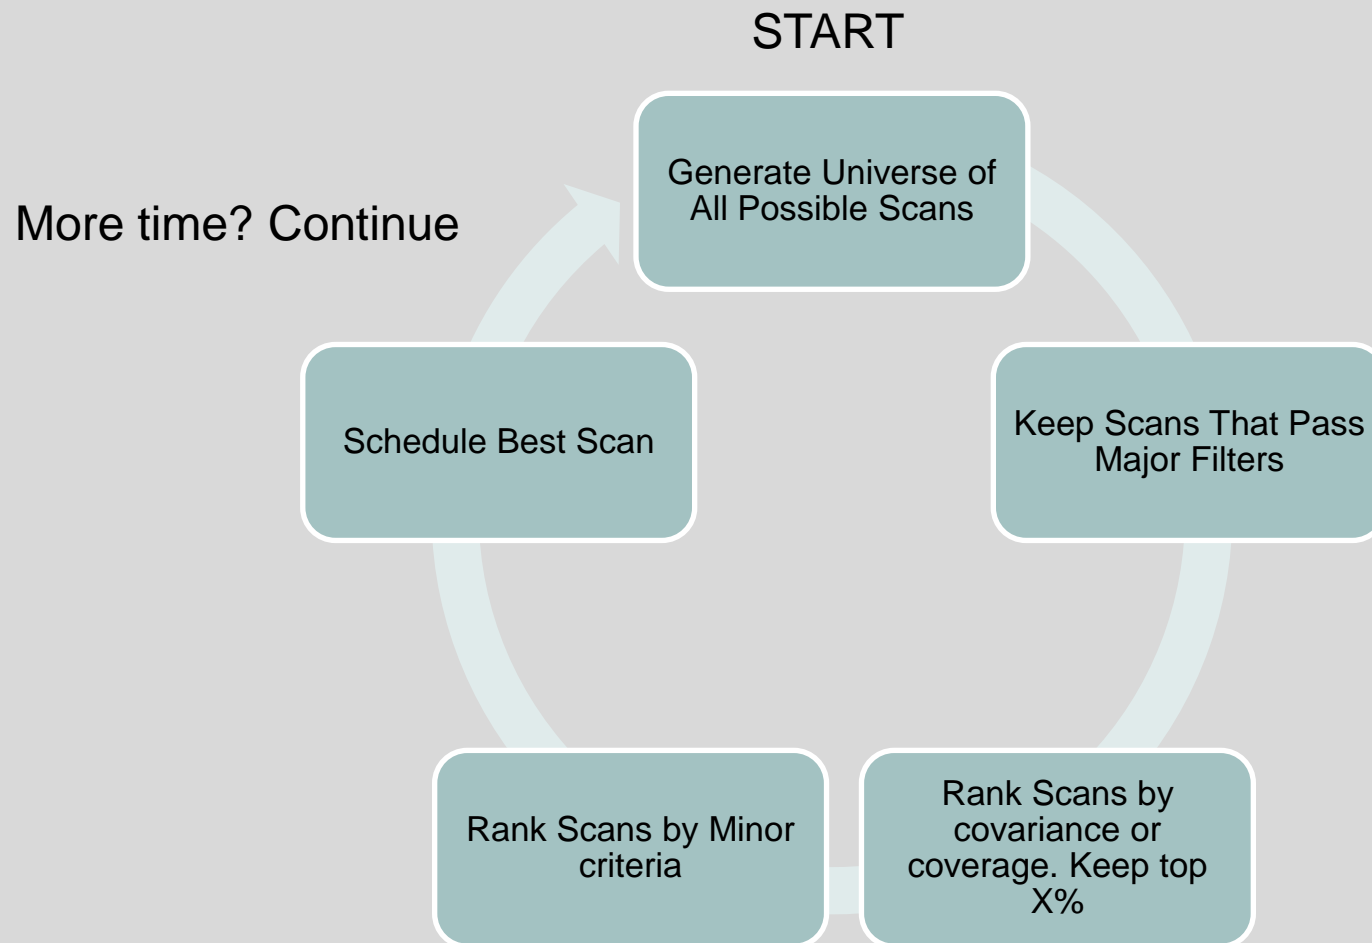

Automatic Scheduling

Automatic Scheduling

Major Options

Option	Description
Subnet	Current subnet. Only stations in this subnet are scheduled.
SkyCov	Do initial ranking by sky coverage (Yes) or covariance (No).
AllBlGood	Do all baselines in a scan need to meet the target SNR to schedule?
MinAngle	Minimum angular distance between successive observations.
MinBetween	Minimum time (minutes) between observations of the same source.
MinSunDist	Minimum angular distance of a source with respect to the sun. If the distance is less than this, the source will not be considered for scans.
MaxSlewTime	Maximum time to allow an antenna to slew. If the slew time at a station is longer than this, the source is not considered visible at that station.
TimeWindow	Window of time (hours) to consider in computing sky coverage or covariance.
MinSubNet	Only schedule scans if the subnet is at least this size.
NumSubNet	Maximum number of subnets to try to schedule at one time.

Major Options

Option	Description
Best	Scans are ranked by Sky coverage or covariance, and the top <i>Best%</i> of the scans kept for further consideration.
FillIn	Turn on fill in mode.
FillMinSub	Minimum size of fill-in subnet.
FillMinTime	Minimum time a station must be idle to be considered for fill-in mode.
FillBest	This is the same as “Best”, but for the fill-in scans. If we are in fill-in mode, the top <i>FillBest% scans are kept for further consideration</i> .
Add_ps	Noise to add (in an RSS sense) to the normal observations. This may affect the ranking of scans by covariance. It also affects the formal errors calculated in the the <i>solve</i> interface.
SNRWts	If yes, weight the observations by SNR. If not, consider all observations the same. This only affects the <i>solve</i> interface.

Major Options (cont)

The general format for setting a major option is:

Major Option Value(s)

Example:

```
Major MinAngle 30
```

Sets the minimum angle between observations to 30 degrees.

Major Option: Fill In Mode

End of scan
↓

1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
2	1	1	1	1	1	1	1	-	-	-	-	-	-	-	-	-	-	-
3	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
4	1	1	1	1	1	1	1	-	-	-	-	-	-	-	-	-	-	-
5	1	1	1	1	1	1	1	1	1	1	1	1	1	-	-	-	-	-
6	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
7	1	1	1	1	1	1	1	1	1	1	1	1	1	-	-	-	-	-
8	1	1	1	1	1	1	1	1	1	-	-	-	-	-	-	-	-	-

By default, *sked* tries to schedule full net-work scans.

The next scan would start as soon after the end of the scan as possible.

This can leave a lot of time when stations are not observing.

“Fill In Mode” attempts to decrease idle time by filling in the gaps.

Fill In Mode

When to start fill-in scan?

Strategy: Find possible starting times, and calculate how much idle time we could eliminate.

Idle Stations	# Stations	Time Left	Maximum Fill Time
2,4	2	10	20
2,4,8	3	8	24
2,4,5,7,8	5	4	20

2nd option maximizes possible fill time

Fill In Mode

Allowable spillover

1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
2	1	1	1	1	1	1	1	-	-	2	2	2	2	2	2	2	2	-
3	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
4	1	1	1	1	1	1	1	-	-	2	2	2	2	2	2	2	-	-
5	1	1	1	1	1	1	1	1	1	1	1	1	1	3	3	3	3	3
6	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
7	1	1	1	1	1	1	1	1	1	1	1	1	1	3	3	3	3	3
8	1	1	1	1	1	1	1	1	1	2	2	2	2	2	2	2	2	-

Repeat until all the idle time is filled.

Fill In mode results in:

1. More observations
2. Fewer large network scans
3. More smaller network scans
4. More scans per station

Fill In Mode

Allowable spillover

1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
2	1	1	1	1	1	1	1	-	-	2	2	2	2	2	2	2	2	-
3	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
4	1	1	1	1	1	1	1	-	-	2	2	2	2	2	2	2	-	-
5	1	1	1	1	1	1	1	1	1	1	1	1	1	3	3	3	3	3
6	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	1	-
7	1	1	1	1	1	1	1	1	1	1	1	1	1	3	3	3	3	3
8	1	1	1	1	1	1	1	1	1	2	2	2	2	2	2	2	2	-

Repeat until all the idle time is filled.

Fill In mode results in:

1. More observations
2. Fewer large network scans
3. More smaller network scans

How Major Works

Source too close to Sun

Source observed too recently

Source too close to previous source

Scans With Remaining Sources

Arrive at set of sources to consider.

Now generate Scans with these sources.

Questions & Commen

Source too close to Sun

Source observed too recently

Source too close to previous source

Use Major filters and SNR targets to eliminate scans.

Scans With Remaining Sources

Subnet too small

Start throwing scans away.

Questions & Commen

Source too close to Sun

Source observed too recently

Source too close to previous source

Use Major filters and SNR targets to eliminate scans.

Scans that Pass Major Filters

Subnet too small

Station takes too long to slew

Scan doesn't meet SNR targets on enough baselines

Left with a much smaller universe.

Major Options

Scans that Pass Major Filters

Major Options

Scans that Pass Major Filters

Rank and throw away bottom

1. Rank sources by **sky-coverage** or by **covariance**.
2. Keep top X% (usually 25-50%) and throw away rest

How to rank and what percentage to keep are controlled by the Major Options
SkyCov and **Best**

Minor Options

Option	Description
Astro	Prefer scans with astrometric sources.
BegScan	Prefer scans which start earlier.
EndScan	Prefer scans which end earlier.
LowDec	Prefer scans with low declination sources.
NumLoEl	Prefer scans which involve sources which are low at one or more sites.
NumRiseSet	Prefer scans involving sources which are setting at one or more sites.
NumObs	Prefer scans with more observations.
SkyCov	Prefer scans with better sky coverage.
SrcEvn	Try to even up the distribution of observations by source.
SrcWt	Prefer scans involving certain sources.
StatEvn	Try to even up the distribution of observations by stations.
StatIdle	Prefer scans which minimize station idle time.
StatWt	Prefer scans involving particular stations.
TimeVar	Prefer scans where all stations end close to the same time.

Scoring with Minor Options

1. A minor option can be either ON or OFF.
2. The “ON” options are assigned weights by the scheduler.
3. For each minor option that is on, *sked* calculates a score.
4. The final score for each scan is the weighted sum.

$$\textit{Total Scan Score} = \sum_{\textit{options}} Wt_j \textit{Score}_j$$

The “best scan” is the scan with the highest total score.

This is the scan that is scheduled.

Minor Options (Cont)

All of the minor options are things that are generally considered 'good', or are desirable in some circumstances.

You can turn the minor options on or off, and vary the weight of the different options to emphasize different characteristics.

The command to do so is very similar to the Major Options:

Minor Option [ON|OFF] Weight Aux

9 Step R1 Schedule

```
jmg/schedules>cp r1412.skd r1413.skd  Start with a similar schedule
jmg/schedules>sked r1413.skd          Open it in sked.
... sked displays info about schedule
? param exper r1413                  Change the experiment key
? master get                          Initialize the session using the masterfile
... sked displays information about the new session.
... sked prompts you if it finds potential problems.
? best 60                            Select the best sources for this session
... sked finds the best sources, and reports problems.
? Down kk-wz 18:00-20:00              Set downtime because of intensives.
? Auto _ end                          Generate schedule until end of the session
...sked generates scans and schedules them, displaying the progress on the
screen.
? Wr                                  Write out the schedule
? Quit
```

What a Sked File Looks like

A Sked file is an ASCII File comprised of several sections.

Demonstration of Using Sked

In this section I demonstrate how to use sked by generating some simple schedules.

Questions & Comments

?

Special Cases

Q: What happens if a sked stops before finishing the schedule?

A: This frequently happens if there are no legal scans left. Try scheduling a few scans and then restarting, or relaxing some of the constraints (MinAngle, MinBetween, Best)

Q: My schedule has very observations on station XYZ. What can I do.

A: This frequently happens with smaller stations. Try using the Minor Option StatWt together with the StatWt command to weight scans with this station more heavily.
